Should we stop flying on holiday?

You are going to read a text about meetings. Some words are missing. Use the words in brackets to form a new word for each gap!

One of the problems with comparing the _____ (CONTRIBUTE) of different forms of transport is that they all take different routes. We looked at a hypothetical journey from London to Naples in Italy and calculated the carbon _____ (EMIT) released into the atmosphere by making the journey by air, land and sea.

We also considered some more _____ (USUAL) options. Would travelling by horse actually be carbon neutral, for example? A horse emits about 18 kg of methane a year. This is equivalent to 378 carbon units because methane is 21 times more _____ (POWER) a greenhouse gas than carbon dioxide.

We can calculate the total contribution by _____ (WORK) out the number of days it would take to make this journey and _____ (MULTIPLY) this by the methane emitted each day.

Going on holiday by horse may appeal to cowboys, but our trip to Italy would take two months each way. _____ (SURPRISE), the car is the next best _____ (CHOOSE), assuming there are three people _____ (SHARE) it. But for a single trip the train would be the _____ (GREEN) option.

Should we stop flying on holiday?

You are going to read a text about meetings. Some words are missing. Use the words in brackets to form a new word for each gap!

One of the problems with comparing the *contributions* (CONTRIBUTE) of different forms of transport is that they all take different routes. We looked at a hypothetical journey from London to Naples in Italy and calculated the carbon *emissions* (EMIT) released into the atmosphere by making the journey by air, land and sea.

We also considered some more *unusual* (USUAL) options. Would travelling by horse actually be carbon neutral, for example? A horse emits about 18 kg of methane a year. This is equivalent to 378 carbon units because methane is 21 times more *powerful* (POWER) a greenhouse gas than carbon dioxide.

We can calculate the total contribution by *working* (WORK) out the number of days it would take to make this journey and *multiplying* (MULTIPLY) this by the methane emitted each day.

Going on holiday by horse may appeal to cowboys, but our trip to Italy would take two months each way. *Surprisingly* (SURPRISE), the car is the next best *choice* (CHOOSE), assuming there are three people *sharing* (SHARE) it. But for a single trip the train would be the *greenest* (GREEN) option.
